General Description:

The Electro-Voice CPS4.10 amplifier offers four independent Class-D Variable Load Drive (VLD) amplifier blocks, each one capable of delivering up to 1000 Watts into Low-Z or High-Z loads. Per default, each channel can be configured individually for max. power output into either 2 Ohms, 4 Ohms, 70V- or 100V- networks without involvement of any output transformers. Being designed for professional audio installation market, special care was taken for long term cost of ownership parameters: In addition to remarkably low current consumption and heat dissipation, the CPS4.10 provides remote standby switching with just 5 Watts consumption in standby mode. An optional remote control module RCM-810 provides control and supervision features via IRIS-Net, including monitoring of amplifier status and real time load supervision. In addition, via RCM-810 the Variable Load Drive characteristics can be set for max. power output into any load between 2 Ohms and 10 Ohms, in steps of 0.1 Ohm.
